ITEC 204 – Data Structures and Algorithms

Name: Lincoln Lete	Date: September 23, 2026
Section: BSIT-2A	Instructor: Maxyne Nueal

- I. **Objective:** Write a short explanation of what your program is designed to do. (Minimum of 3 sentences)

Answer: The program is designed to add and display tickets in the list. It can also search and remove tickets when needed. Lastly, it can count the number of active tickets currently in the list.

Program Operations: Briefly explain how your program performs each operation.
(Insert Specific Code Line and Your Explanation)

Add Incident: `tickets.append([incident_id, bot, description])` This adds new incident ticket to the list.

Display Incidents: `for ticket in tickets:`

`print(ticket)` This display or prints all the incident tickets on the list

Search Incident: `if ticket[0] == incident_id:` This check all the incident tickets and if it match the one you are looking for it'll print or show

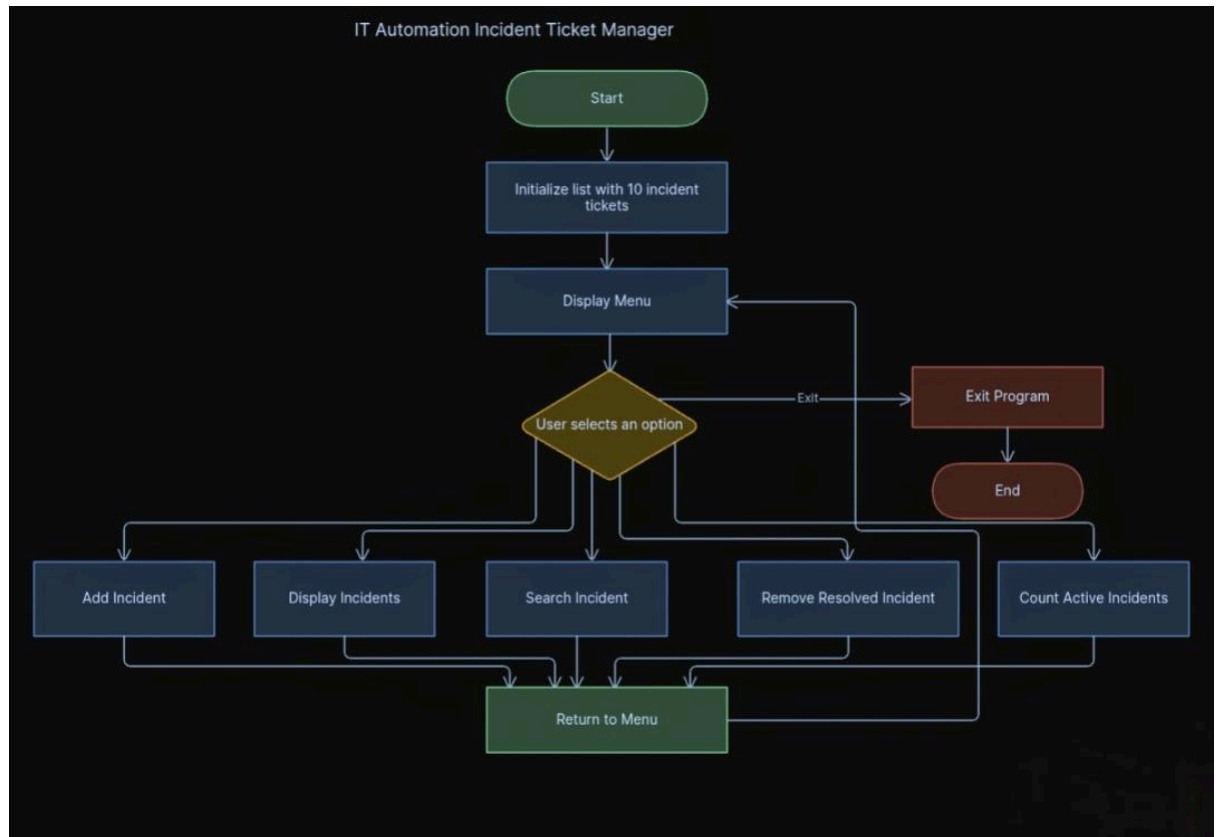

Remove Resolved Incident: `tickets.remove(ticket)` This remove an Incident ticket in the list permanently.

Count Active Incidents: `len(tickets)` This counts the number of incident tickets that is stored on the list showing all the active tickets on the list.

College of Computer Studies

- II. **Flowchart:** Create a flowchart showing the overall process and logic of your program.

- III. **Conclusion:** Briefly explain what you learned from the activity and how the linear data structure was applied.

From this activity, I learned how to use a linear data structure in Python using a list. I learned how to add, display, search, remove, and count incident tickets. The list stores the tickets in order, making it easier to manage and access the incident records. This was taught by sir kaleb din po nung first year 2nd sem.
